RESEARCH

Do EV Charging Stations Care about Electricity Rates? Job Market Paper
Supported in part by the Environmental Science and Policy Program, Michigan State University

· This paper examines the relationship between electricity rate plans and EV charging station installations. I match the number of EV charging stations at the zip code level to commercial electricity rate schedules of investor-owned utility companies in the United States from 2015 to 2022. I also simulate the electricity bills that would be incurred under each rate schedule. Then, I use the synthetic difference-in-differences method and the local projection difference-in-differences method to estimate how newly introduced EV-dedicated electricity tariffs, designed to alleviate the burden of high demand charges, affected electricity bills and EV charging station entries. The results indicate that the introduction of EV-dedicated tariffs led to lower electricity demand charges and 1-2 additional charging ports per zip code.
